

WELLMASTER™

WELL PERFORMANCE ANALYTICS

Introduksjon til gassløftbrønner for risikoanalytikere

ESRA seminar, September 3, 2014, Stavanger
Per Holand, ExproSoft

No gas lift

Gas lifted well, without ASV

Gas lifted well, with ASV

Indicated depths, sizes, and volumes are based on 2-4X

- Reservoir fluid
- Completion fluid (brine)
- Normally open valve
- Normally closed valve

Gas lifted well, No ASV with ASCV

Gas lifted well, No ASV with ASCV and MSAS/HSAS

Base case: Conventional gas lift with ASV, 1 - 4 GLVs

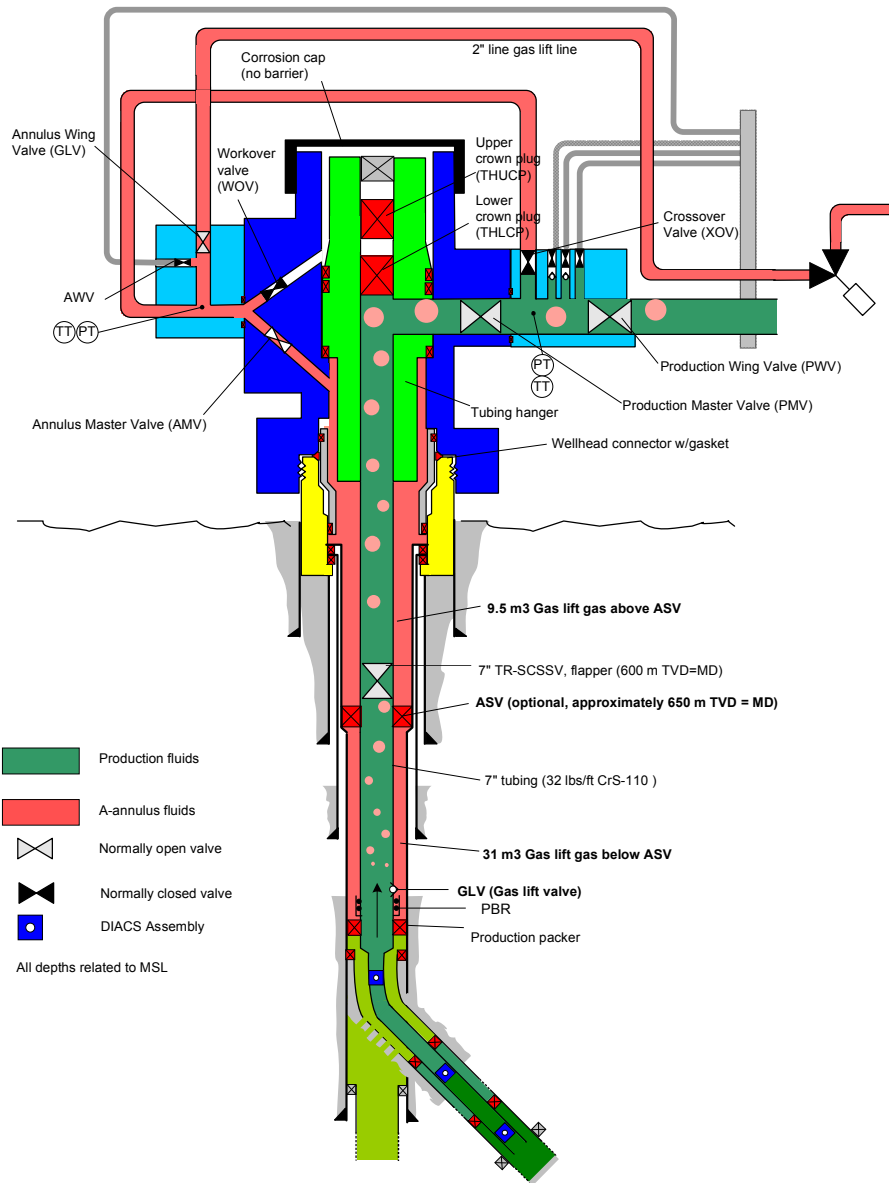

Retrofit, with GLV in straddle and H-ASCV in wellhead

Key factors, both designs:

- Permanent annulus blowdown system
- The second outlet from the wellhead will be blinded off
- The B-annulus will be continuously monitored
- Relatively small annulus volumes compared to other gas lifted wells

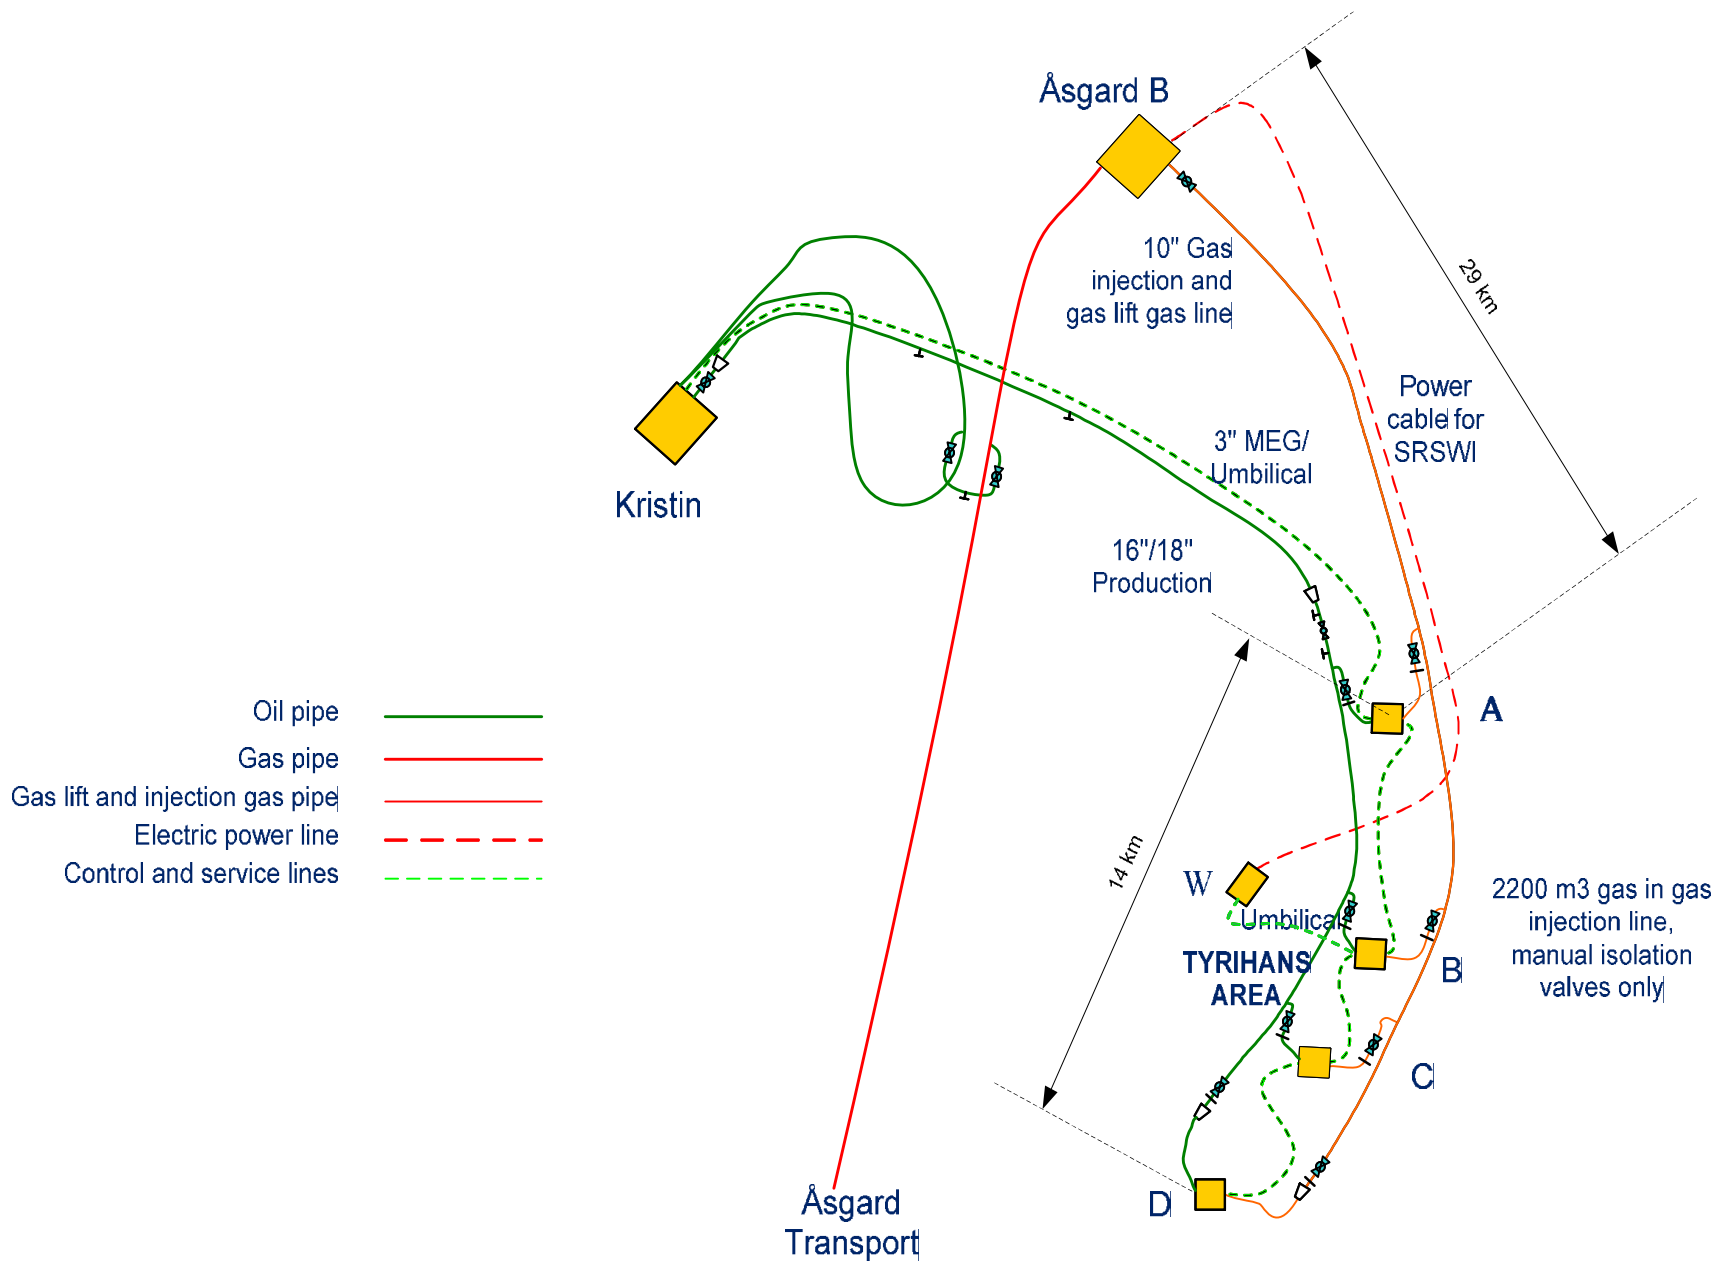

- Base Case: Gas lifted subsea production wells with ASV and shallow set TR-SCSSV

- Case III: Gas lifted subsea production wells with no ASV and deep set TR-SCSSV

Field	Typical volumes of gas lift gas (m3)			Inlet gas pressure (bar)	Platform or subsea
	Above ASV	Below ASV	Total		
Ekofisk typical	4,3	72,0	76,3	125	Platform
Ekofisk M	4,2	153,0	157,2	125	Platform
Statoil Retrofit	2,5	24,0	26,5	130	Platform
Brage	13,0	104,0	117,0	130	Platform
Skinfaks/Rimfaks	9,5	31,0	40,5	245	Subsea
Norne	2,6	33,4	36,0	200	Subsea
Tyrihans	2,8	44,0	46,8	310	Subsea
Fossefall	3,0	26,0	29,0	295	Subsea
Dompap	3,0	29,0	32,0	295	Subsea
Hyme	2,5	20,5	23,0	200	Subsea
Havis	2,3	8,2	10,5	186	Subsea
Skrugard	2,3	5,0	7,3	150	Subsea
Maria	10,0	95,0	105,0	330	Subsea
Ivar Aasen	6,6	26,6	33,2	150	Platform

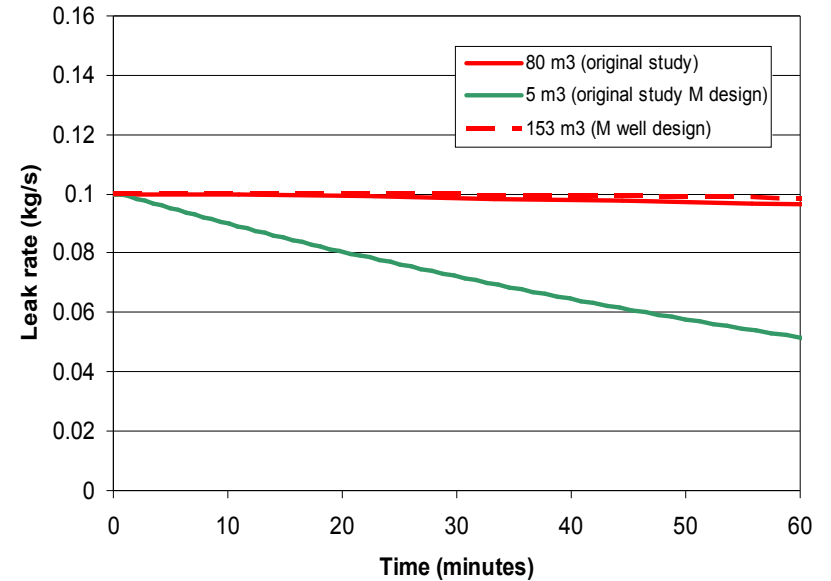

- Note that other, not well related, volumes of gas can be much higher
 - Export risers
 - Gas lift flowlines subsea
 - Gas injection flowlines subsea

Tyrihans area field Sketch

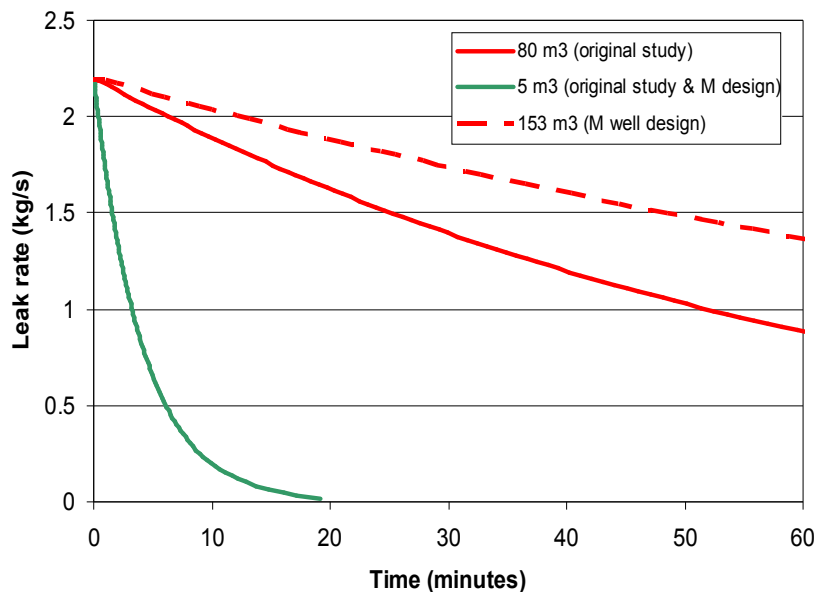

Typical time dependant leak rates associated to typical failures, example from platform completed wells

Leak rate vs. time and volume in annulus (equivalent hole size 2.67 mm)

Leak rate vs. time and volume in annulus (equivalent hole size 12.5 mm)

Leak rate vs. time and volume in annulus (equivalent hole size 37.5 mm)

Leak from 2,725" release point, with and without ASV

- Annulus volumes - above and below ASV
- Annulus pressures
- Annulus barriers wellhead, gas inlet side
- Annulus barriers wellhead, monitoring side
- ASV or not in the well
- ASV closing time
- Surface leak rates and associated probabilities
- Gas lift valve reliability (scale affected)
- No. of GLVs
- Water depth for subsea completions
- ASV related workover risk
- DHSV below GLVs or not
- Blowout risk through annulus
