Per Holand, ExproSoft

LOWC definition

BSEE definition for *Loss of Well Control*:

- Uncontrolled flow of formation or other fluids. The flow may be to an exposed formation (an underground blowout) or at the surface (a surface blowout).
- Flow through a diverter
- Uncontrolled flow resulting from a failure of surface equipment or procedures

Category	Sub category					
	Totally uncontrolled flow, from a deep zone					
Blowout (surface flow)	otally uncontrolled flow, from a shallow zone					
	Shallow gas "controlled" subsea release only					
Blowout (underground	Jnderground flow only					
flow)	Underground flow mainly, limited surface flow					
Well release	Limited surface flow before the secondary barrier was activated					
	Tubing blown out of well, then the secondary barrier is activated					
Diverted well release	Shallow gas controlled flow (diverted)

lated	Netherlands, Canada East	2	3			3					1	9
	Coast, Australia, US Pacific OCS, Denmark, Brazil	22.2 %	33.3 %			33.3 %					11.1 %	
Post of	the world	9	5	4	2	4	7	4		2	2	39
Rest 01	Rest of the world		12.8 %	10.3 %	5.1 %	10.3 %	17.9 %	10.3 %		5.1 %	5.1 %	
Total	Total		35	4	10	33	12	14	7	6	4	156
TUtai		19.9 %	22.4 %	2.6 %	6.4 %	21.2 %	7.7 %	9.0 %	4.5 %	3.8 %	2.6 %	

External causes are typical; storm, military activity, ship collision, fire and earthquake.

*

LOWC categories in US GoM OCS and "Regulated area"

	Deep 2	zone LOW	Cs	Shallow	zone LOW	/Cs	
Main category	Regulated area	US GoM OCS	Total	Regulated area	US GoM OCS	Total	Total
Blowout (surface flow)	8	30	38	4	12	16	54
Blowout (underground flow)	1	3	4				4
Diverted well release		2	2	2	8	10	12
Well release	20	25	45		2	2	47
Total	29	60	89	6	22	28	117

Regulated areas:

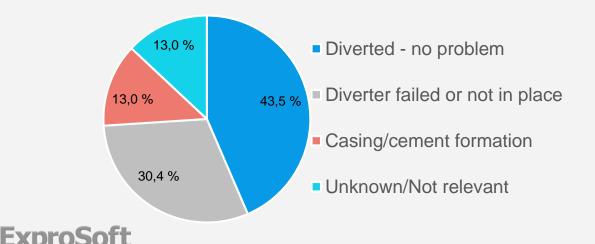

UK, Norway, Netherlands, Canada East Coast, Australia, US Pacific OCS, Denmark, Brazil

LOWC causes, shallow drilling (before landing BOP)

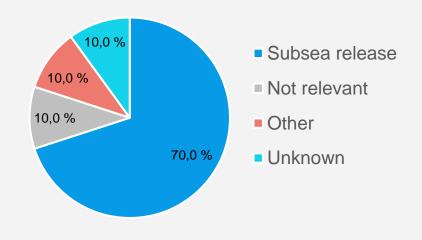

Shallow zone flow handling, Drilling with riser (bottom fixed installation)

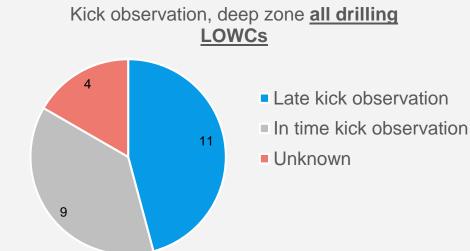

Shallow zone kick causes

- Too low hyd. head (high well pressure/low mud weight)
- Too low hyd. head (losses/ swabbing/ unknown)
- Too low hyd. head (while cement setting)
- Poor cement

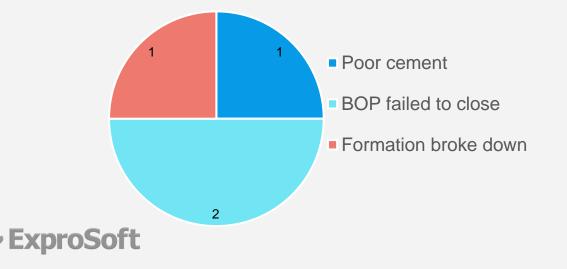

Shallow zone flow handling, Drilling without riser (floating drilling)

LOWC causes, deep drilling (after BOP landed)

Floating vessel, secondary barrier failure in deep zone drilling *Blowout (surface flow)*

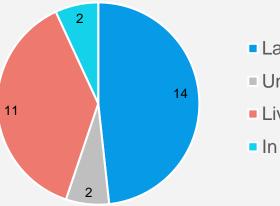

Bottom fixed installation, secondary barrier failure in deep drilling <u>Blowout (surface flow)</u>

- Wellhead area leak
- String safety valve failed
- Casing failed
- BOP failed after closure
- BOP not in place
- Not relevant, one barrier only

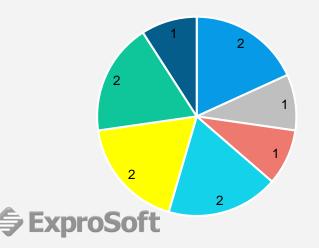

LOWC causes, workovers

Workover LOWC observation

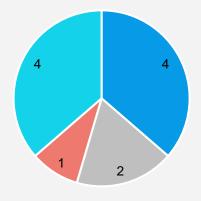

- Late kick observation
- Unknown
- Live well
- In time kick observation

Loss of secondary barriers in workover **Blowout** (surface flow)

- Casing leakage
- Failed to close BOP
- Outer casing an inner casing failed
- String safety valve not available
- Tubing and casing leak
- Wellhead failed
- X-mas tree failed and casing leakage

Loss of primary barrier for workover LOWCs in *live wells*

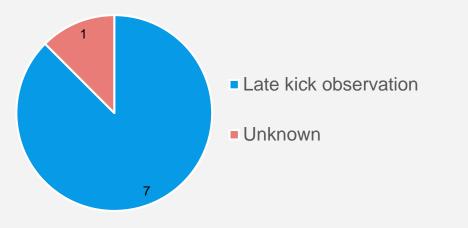

- SCSSV/storm choke failure
- Snubbing equipment failure
- Tubing plug failure
- Tubing to annulus leakage/parted

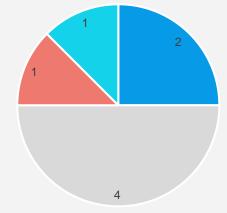

4 of the 11 *blowout (surface flow)* and 4 of the *well releases* were in wells that should be permanently abandoned. Many of them had been suspended/closed in for many years

LOWC causes, completions

Completion LOWC observation

Loss of secondary barrier for completion LOWCs

- Failed to close BOP
- Failed to close BOP (closed late)

2

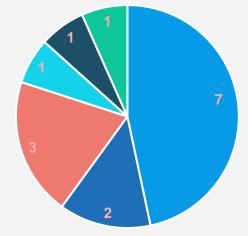

- Failed to stab string safety valve
- String safety valve failed

For the two *Blowout (surface blowout)* LOWCs the BOP failed to close

Loss of primary barrier for completion LOWCs

- Too low hyd. head, too low mud weight
- Too low hyd. head, unknown why
- Too low hyd. head, trapped gas
- Too low hyd. head, annular losses
- Too low hyd. head, swabbing
- Packer plug failure

LOWC causes, production

Loss of primary barrier for production LOWCs

- SCSSV failure, failed to close
- SCSSV failure, leaking
- SCSSV failure, closed late
- Tubing leakage
- Tubing plug failure and tubing leakage
- Unknown

Loss of secondary barrier for production LOWCs

- Wellhead/X-mas tree failed, failed to close
- Wellhead/X-mas tree failed, leak
- Wellhead/X-mas tree failed, storm damage
- Wellhead/X-mas tree failed, collision damage
- Wellhead/X-mas tree failed, underwater land slide
- Casing/cement/ formation
- Unknown

Kick statistics

Total	5	47 683	1.05	21	77 843	2.70	2,4		

	U	K & Norwegia	n waters				
Comple- tion	No. of LOWCs	Number of well completions	Frequency per 1 1 000 wells completed	No. of LOWCs	Number of well completions	Frequency per 1 000 wells completed	US GoM OCS vs. Norway and UK
Total	5	5 305	0.94	3	5 004	0.60	0,6

Fatalities in LOWC events, worldwide 2000 - 2015

		Sum of Fatali	ities in L(OWCs	
Country	Development	Exploration	Work-	Prod-	Total
	drilling	drilling	over	uction	TOLAI
Azerbaijan				32	32
Mexico				23	23
Nigeria		2			2
Saudi Arabia				3	3
US GoM State water	1				1
US GoM OCS		12	1		13
Total	1	14	1	58	74

- In the US GoM OCS one LOWC event caused 11 fatalities (Deepwater Horizon) and two LOWC events caused one fatality.
- A LOWC in Azerbaijan caused 32 fatalities in 2015. A LOWC in Mexico in 2007 caused 23 fatalities. Both these events occurred in the production phase, and the personnel died during evacuation.
 ExproSoft

Pollution from LOWC Events, US GoM and "regulated" areas, 2000 - 2015

Major pollution incidents, all drilling

- 2009 Australia, Montara: A total volume of **29,600 barrels**, or 400 barrels per day.
- 2010 USA, Macondo: 50,000 barrels a day in 85 days, **4,250,000 barrels**
- 2011 Brazil, Frade field: 600 barrels per day or **3,700 barrels** in total.

Storm related Production wells

• A storm created an underwater landslide that toppled a US GoM OCS platform in 2004. Wells are still leaking, total volume since 2004 is 6,000 – 25,000 barrels

Other,

- One drilling LOWC event in 2000 caused a release of 150–200 barrels of crude oil
- One abandoned well spilled 62 barrels before being controlled in 2010.
- Some workover and completion LOWC events were listed with minor pollution.
- In the period 1980–1999, none of the LOWC events in the US GoM OCS, Norway, or UK caused a large pollution incident.

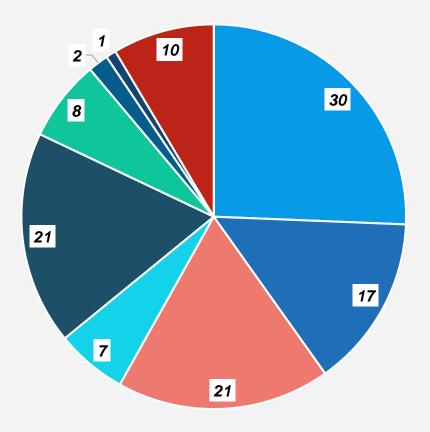

Ignition of LOWCs, US GoM and "regulated" areas, 2000 - 2015

Main category	Ignition time grouped	Dev. drilling	Expl. drilling	Compl- etion	Work- over	Prod- uctio n	Wire- line	Abando- ned well		Total	Distri- bution %
	Immediate ignition		2			1		1		4	7.4 %
Blowout (surface	Delayed ignition	3		1						4	7.4 %
flow)	No ignition	10	14	1	11	7	1	1	1	46	85.2 %
	Total	13	16	2	11	8	1	2	1	54	100.0 %
	No ignition	1	3							4	100.0 %
(undergro- und flow)	Total	1	3							4	100.0 %
Diverted	No ignition	6	5	1						12	100.0 %
well release	Total	6	5	1						12	100.0 %
	Immediate ignition		1		1					2	4.3 %
Well release	No ignition	2	5	5	17	7	6	2	1	45	95.7 %
	Total	2	6	5	18	7	6	2	1	47	100.0 %
Total all		22	30	8	29	15	7	4	2	117	

• Ten (8.5%) of the 91 LOWC events ignited

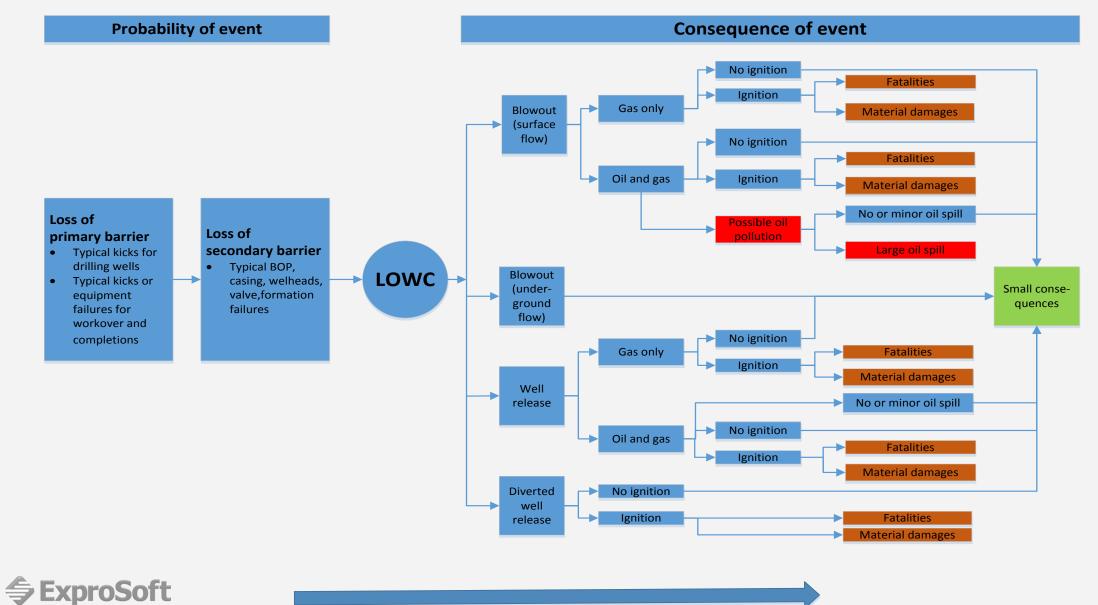

Control of LOWCs

How flow from LOWCs were stopped, "regulated" areas incl US GoM OCS 2000-2015

- BOP
- Bridged/ceased/depleted
- Capped
- Cemented
- Mud
- Other
- Relief well
- Still flowing
- Unknown

Risk model, future risk

Predicted 5-year risk level US GoM OCS, based on 2015 activity level

				Risk re	sults			
		No. of			Material	damages		
Activity type	No. of LOWCs to expect	ignited events to expect	No. of fatalities to expect	Total Loss	Severe	Damage	Small-/no	Large spill probability
Exploration drilling from bottom fixed installation	0.149	0.014	0.021	0.0071	0.0035	0.0053	0.1330	0.0052
Exploration drilling from floating vessel	3.018	0.275	0.361	0.1118	0.0815	0.1095	2.7156	0.0734
Development drilling floating or bottom fixed installation	1.376	0.118	0.174	0.0574	0.0305	0.0449	1.2436	0.0140
Workover	4.559	0.401	0.490	0.1447	0.1278	0.1640	4.1227	0.0352
Completion	0.264	0.017	0.021	0.0065	0.0051	0.0068	0.2454	0.0040
Production	2.605	0.294	0.404	0.1287	0.0828	0.1150	2.2788	0.0521
Wireline	0.651	0.028	0.014	0.0000	0.0139	0.0139	0.6236	0.0000
Total all	12.62	1.15	1.49	0.46	0.34	0.46	11.36	0.18

* A large spill includes spills with a total release above from 500 barrels.

Risk reduction

- Reduce the kick frequency, US GoM OCS kick frequency is high compared to UK and Norwegian kick frequencies
- **Improve kick detection**. For a large proportion of the serious LOWCs in drilling, completion, and workover operations the kick is not observed before the well is flowing to the surroundings
- Be prepared that the barrier situation in a well that shall be worked over may be different than expected
